Towards a circular economy for plastics in China:
Opportunities and recommendations
TOWARDS A CIRCULAR ECONOMY FOR PLASTICS IN CHINA: OPPORTUNITIES AND RECOMMENDATIONS

Preamble

Towards a circular economy for plastics in China report

Today, the circular economy for plastics is at a turning point. There is a widespread understanding and sense of urgency around the need to tackle the plastic problem at source. This is the time for China to activate circular solutions to drastically shift the way plastics are made and used in China and globally. This report intends to show how this can be done.

By taking China’s plastic packaging industry as the entry point, the report highlights the path and opportunities of the circular economy transformation for plastics and identifies a set of specific actions. A series of recommendations are also provided for policymakers and businesses to enable the circular economy transition.

Drawing on the New Plastics Economy vision, and two previous reports The New Plastics Economy: Rethinking the future of plastics (2016) and The New Plastics Economy – Catalysing action (2017), this new report is the Ellen MacArthur Foundation’s first China-focused study on plastic. Written in collaboration with Tsinghua University, it aims to inspire and empower a wide range of actors towards a circular economy for plastics in China.
Now is the time for China to accelerate a circular economy for plastics

- As the biggest manufacturer, user, and exporter of plastics in the world, China has a unique role to play in driving the transition to a circular global plastics economy
- A fundamental rethink of the way plastic is produced, used, and reused is required to solve plastic pollution
- A circular economy for plastic is essential for China to meet its plastic objectives, and support its carbon emission goals and broader environmental agenda

Challenges and opportunities for China to transition to a circular economy

- The foundation of a policy framework for the circular economy is already in place, but gaps remain
- The voluntary efforts of the plastics industry provide a useful starting point but are still siloed and focused on waste management practices
- There are great opportunities for upstream innovation to design out waste
- Successful examples in China and internationally provide inspiration

Action plan for China

- Policymakers and businesses can take action in three main areas: design, system and infrastructure, and incentives
- Establish a cross-value chain dialogue to achieve a common vision and targets
- China can play an active and leading role in the development of an ambitious UN treaty on plastic pollution
Now is the time for China to accelerate a circular economy for plastics
As the biggest manufacturer, user, and exporter of plastics in the world, China has a unique role to play in driving the transition to a circular global plastics economy.

- In China, 60 million tonnes of plastic waste were generated in 2020, of which approximately 35% was landfilled, 37% incinerated, and only 26.7% (16 million tonnes) was recycled.
- China’s packaging production has been growing since 2018 with an average annual growth rate of 8.7%, reaching 45 million tonnes in 2020.
- We take raw materials out of the ground, make products and packaging, and throw them away as waste. This linear plastics system causes environmental issues, affects the health and livelihoods of some of the poorest communities but also creates a significant economic value loss.
- Globally, the cost of negative externalities associated with plastic packaging escaping collection systems has been conservatively estimated by UNEP at USD 40 billion (~RMB 258 billion).
- Most efforts to tackle plastic pollution have focused on waste management and environmental clean-ups. These downstream efforts, including collection, sorting and recycling, are needed, and will require investment globally, but they cannot alone represent an effective response to the problem.
A fundamental rethink of the way plastic is produced, used, and reused is required to solve plastic pollution.

The circular economy for plastics offers a vision in which plastic never becomes waste. It presents a fundamental rethink of plastics and plastic packaging, envisioning a more effective system to achieve better economic and environmental outcomes.

The circular economy for plastics provides an actionable framework around 3 principles:

1. **Eliminate** problematic and unnecessary plastics
2. **Innovate** to ensure that all necessary plastics are reusable, recyclable, or compostable
3. **Circulate** all the plastic items we use to keep them in the economy and out of the environment

Over 1,000 businesses, governments, NGOs, and other actors across the world have united behind a common vision of a circular economy for plastics and committed to concrete 2025 targets.
A circular economy for plastics is essential for China to meet its plastic objectives, and support its carbon emission goals and broader environmental agenda.

In line with the Chinese government targets for carbon neutrality by 2060 and the creation of a ‘green, low-carbon society’, the circular economy offers a systems solution framework that builds a resilient economy and delivers both long-term prosperity and addresses global challenges such as climate change, biodiversity loss, waste and pollution.

This transformation, which reaches far beyond incremental or end-of-pipe actions to simply improve waste management and better recycling, can help China achieve its vision of Ecological Civilisation.

Compared with a business-as-usual scenario, a comprehensive global circular economy approach has the potential to:

- Reduce the annual volume of plastics entering our oceans by over 80%.
- Reduce greenhouse gas emissions by 25%.
- Generate savings of USD 200 billion per year.
- Create 700,000 net additional jobs by 2040.
Now is the time for China to accelerate a circular economy for plastics

- As the biggest manufacturer, user, and exporter of plastics in the world, China has a unique role to play in driving the transition to a circular global plastics economy
- A fundamental rethink of the way plastic is produced, used, and reused is required to solve plastic pollution
- A circular economy for plastic is essential for China to meet its plastic objectives, and support its carbon emission goals and broader environmental agenda

Challenges and opportunities for China to transition to a circular economy

- The foundation of a policy framework for the circular economy is already in place, but gaps remain
- The voluntary efforts of the plastics industry provide a useful starting point but are still siloed and focused on waste management practices
- There are great opportunities for upstream innovation to design out waste
- Successful examples in China and internationally provide inspiration

Action plan for China

- Policymakers and businesses can take action in three main areas: design, system and infrastructure, and incentives
- Establish a cross-value chain dialogue to achieve a common vision and targets
- China can play an active and leading role in the development of an ambitious UN treaty on plastic pollution
Challenges and opportunities for China to transition to a circular economy
The foundation of a policy framework for the circular economy is already in place...

Since the 1990s, China has gradually developed a plastic pollution policy framework:

### Stage 1. Targeted bans and the first Circular Economy Law

To curb the “white pollution”, certain types of single-use items (styrofoam food containers and ultra-thin plastic shopping bags) are banned, marking the beginning of the fight against plastic pollution in China.

As early as 2005, the Chinese government launches circular economy demonstration projects, including a pilot project on plastic recycling.

The rollout of a 3R strategy is included in the 2008 first Circular Economy Promotion Law.
Stage 2. Plastic recycling system established with the development of the circular economy

After successive action plans in 2013 and 2015, the circular economy becomes a national development strategy.

With increased recycling capacity, China becomes the largest plastic waste importer, and processes one-quarter of global plastic waste.

In 2015, the vision of Ecological Civilisation and plan was developed.
Stage 3. From a foreign waste ban to a more integrated approach

2017 marks a breakthrough with the policy banning imports of waste materials including plastics, paper, and metal scrap, whilst China aims to improve the domestic waste recycling market by upgrading regulations and standards.

The 14th Five-Year Plan leverages circular economy strategies to manage plastic pollution and recommends sets of actions such as redesign of key products; increasing waste collection and recycling; governance for plastic pollution, etc.
...but gaps remain

By now, a strong interaction between plastic pollution management policy and the circular economy development plan has been established, which provides an opportunity to advance a more comprehensive policy framework for plastic in China. However, currently, gaps in the policy agenda still remain:

- Policies and standards for the packaging value chain are currently mostly voluntary (e.g. design-for-recycling guidelines), siloed or overlapping with each other. Coordination and harmonisation efforts can be made under the current discussion on “eco-design”. Common standards must be harmonised and adopted.
- EPR scheme for all packaging, as a key mechanism for financing the collection, sorting and recycling of packaging, can be explored, given that it is a proven way to make the economics of packaging recycling work.
- Circular development for the plastic packaging industry is not fully integrated within current policy initiatives, such as Zero-Waste Cities initiatives and waste sorting schemes.
- To date, to avoid plastics waste and pollution, and meet China’s objectives, the focus has been mainly on end-of-pipe waste management and only limited solutions to avoid waste from being generated in the first place have been adopted.

China’s objectives to control plastic pollution (from the 14th FYP)

1. Reduce single-use plastic production and consumption at source
2. Improve plastic waste collection and recycling
3. Establish the whole chain management system of plastic pollution
4. Reduce plastic waste leakage
The voluntary efforts of the plastics industry provide a useful starting point but are still siloed and focused on waste management practices.

1 The current plastic system is linear and not fully monitored, which requires further coordination and integration.

There are efforts downstream, but much more is needed.

- Plastic recycling has covered a variety of types, amounting to 19 million tonnes in total in 2021, but it is not clear how much is post-consumer waste. (see the figure on the left)
- Although recycled PET amounts to 4.8 million tonnes, 78% is used for the fibre industry, and close-loop recycling (i.e. bottle-to-bottle) is very limited.
- The plastic recycling industry involves 0.9 million workers, with a majority (nearly 80%) being self-employed or small businesses (referred to as the informal sector).

More importantly, the transition to a circular plastics economy requires prioritisation of upstream efforts.
There are great opportunities for upstream innovation to design out waste.

To unlock the full opportunity, it is necessary to move beyond focusing on incremental packaging improvements. Design is the fundamental starting point to achieving the circular economy vision, and a key step to eliminating plastic waste at source. Packaging redesign goes beyond the appearance and function of the packaging itself, and instead includes the design of the product, business model, and distribution system.

**ELIMINATION** Packaging is eliminated while the user experience is maintained or enhanced.
- Direct elimination
- Innovative elimination

**REUSE** Packaging is reused, rather than discarded after one use, creating value for both users and businesses.
- Refill at home
- Return from home
- Return on the go
- Refill on the go
- Business to business

**MATERIAL CIRCULATION** Packaging is designed so that the materials it is made from can be recycled or composted.
- Plastics recycling
- Plastics composting
- Substitution to a non-plastic material
Successful examples in China and internationally provide inspiration.

To understand how to apply the upstream innovation mindset to achieve the three key circular economy innovation strategies: elimination, reuse, and material circulation, find here more than 110 innovation case studies and references. This database shows what good looks like in practice.

In China, local brands set ambitious circular economy targets for plastic packaging: Nongfu and Mengniu for example have pledged to achieve 100% reusable, recyclable or compostable packaging by 2025.

Other businesses are exploring circular business models such as:

**ELIMINATION**
- 65% of e-commerce delivery has eliminated additional packaging by 2020.

**REUSE MODELS**
For the Chinese express delivery industry,
- the take-up rate of reusable B2B bags is over 90%.
- A target “to increase the use of B2C reusable delivery packaging to 10 million by 2025” was set in the 14th Five Year Plan.

**MATERIAL CIRCULATION**
- Production capacity for closed-loop recycling (i.e. bottle-to-bottle) is growing, with four companies having their production lines in China approved by the U.S. Food & Drug Administration (FDA) to produce food-contact packaging material (at an annual capacity of nearly 300,000 tonnes) - Veolia Huafei, Incom, Guolong, Ceville
- Use post-consumer recycled plastic in packaging – Mengniu
Now is the time for China to accelerate a circular economy for plastics

- As the biggest manufacturer, user, and exporter of plastics in the world, China has a unique role to play in driving the transition to a circular global plastics economy
- A fundamental rethink of the way plastic is produced, used, and reused is required to solve plastic pollution
- A circular economy for plastic is essential for China to meet its plastic objectives, and support its carbon emission goals and broader environmental agenda

Challenges and opportunities for China to transition to a circular economy

- The foundation of a policy framework for the circular economy is already in place, but gaps remain
- The voluntary efforts of the plastics industry provide a useful starting point but are still siloed and focused on waste management practices
- There are great opportunities for upstream innovation to design out waste
- Successful examples in China and internationally provide inspiration

Action plan for China

- Policymakers and businesses can take action in three main areas: design, system and Infrastructure, and incentives
- Establish a cross-value chain dialogue to achieve a common vision and targets
- China can play an active and leading role in the development of an ambitious UN treaty on plastic pollution
Action plan for China
The government and businesses need to develop comprehensive and ambitious circular economy strategies and action plans, aiming to:

- Eliminate unnecessary or problematic packaging
- Significantly increase the use of reusable packaging
- Ensure all packaging is recyclable and recycled in practice
- Increase the use of recycled content, to decouple plastic use from fossil resource consumption
- Carefully assess the use of compostable packaging where relevant

And actions can happen in three main areas:

1. Design
2. Systems and infrastructure
3. Incentives

Establish a cross-value chain dialogue to achieve the above objectives.

A legally binding UN Plastic Treaty on plastic pollution that:

- Focus on ways to stop the plastic pollution at source, beyond clean ups.
- Set global standards.
- Support all countries to play their part.
Policymakers and businesses can take action in three main areas:

<table>
<thead>
<tr>
<th>Policy priorities:</th>
<th>Business priorities:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Establish mandatory design requirements</td>
<td>1 Develop design guidance</td>
</tr>
<tr>
<td>2 Lead the creation of necessary systems and infrastructure</td>
<td>2 Work across the value chain to build systems and infrastructure</td>
</tr>
<tr>
<td>3 Develop regulatory and financial incentives</td>
<td>3 Develop incentives for customers</td>
</tr>
</tbody>
</table>

Activating mechanism could:
- Break the silo, bridge communications, enhance collaborations, lead to concerted actions

Enabling condition could:
- Deliver industry-scale change and end plastic pollution
Eliminate unnecessary or problematic packaging

<table>

</table>
## Key initial priorities for policymakers:

<table>
<thead>
<tr>
<th>Design</th>
<th>Systems and infrastructure</th>
<th>Incentives</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Develop reusable packaging targets and standards to increase the proportion of reusable packaging.</td>
<td>1. Establish Extended Producer Responsibility (EPR) schemes for all packaging, as EPR can be an incentive to drive companies towards reuse.</td>
<td>1. Introduce fiscal incentives and subsidies (e.g., VAT deduction or expanding the scope of tax preferential to the reusable businesses) to encourage the development of reusable packaging and related business models.</td>
</tr>
<tr>
<td>2. Improve the health and safety standards for reusable/refill appliances with an implementation plan.</td>
<td>2. Promote harmonisation of shared infrastructure to facilitate/enable scaling of reuse models.</td>
<td>2. Eco-modulation of EPR fees to incentivise design for reuse and recycling.</td>
</tr>
</tbody>
</table>

## Significantly increase the use of reusable packaging

### Key initial priorities for businesses:

| 1. Develop a clear reuse strategy with tangible ambitions and clear implementation plans. | 1. Start pilot reuse projects and proactively work towards addressing the barriers to taking pilots to scale. | 1. With bulk sale options, encourage and accept customers’ own reusable containers. |
| 2. Standardise containers to enhance reuse efficiency. | 2. Actively engage with supply chain to test the design of reusable packaging, products, and delivery systems, and set up reuse delivery and distribution models. | 2. Set up discount or rewards scheme for reuse and recycling. |
| 3. Review packaging ranges and portfolios to identify opportunities for reuse. | 3. Share learnings from reuse pilots. | 3. Test deposit and return schemes with retailer involvement to incentivise packaging collection. |
## Ensure all packaging is recyclable and recycled in practice

### Key initial priorities for policymakers:

<table>
<thead>
<tr>
<th>1 Design</th>
<th>2 Systems and infrastructure</th>
<th>3 Incentives</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Develop harmonised standards to support packaging recyclability assessment.</td>
<td>1 Develop harmonised labels for recyclability to facilitate effective collection and recycling for plastic packaging.</td>
<td>1 Introduce fiscal incentives and subsidies (e.g., VAT deduction or expanding the scope of tax preferential to the recycling businesses) to encourage the development of recycling system and material innovations.</td>
</tr>
<tr>
<td>2 Establish Extended Producer Responsibility (EPR) schemes for all packaging, as EPR drives the market towards better design and recycling.</td>
<td>2 Introduce fiscal incentives and subsidies (e.g., VAT deduction or expanding the scope of tax preferential to the recycling businesses) to encourage the development of recycling system and material innovations.</td>
<td>2 Establish policy instruments, such as landfill tax, incineration gate fees to further reduce waste and incentivise recycling.</td>
</tr>
<tr>
<td>3 Develop an inclusive waste management system to gradually incorporate the informal sector.</td>
<td>3 Develop an inclusive waste management system to gradually incorporate the informal sector.</td>
<td>3 Eco-modulation of EPR fees to incentivise design for reuse and recycling.</td>
</tr>
<tr>
<td>4 Improve the information management of waste collection and recycling.</td>
<td>4 Improve the information management of waste collection and recycling.</td>
<td></td>
</tr>
<tr>
<td>5 Raise social awareness to enhance public perception of recycling and use of high-quality recycled materials.</td>
<td>5 Raise social awareness to enhance public perception of recycling and use of high-quality recycled materials.</td>
<td></td>
</tr>
</tbody>
</table>

### Key initial priorities for businesses:

| 1 Innovate towards 100% reusable, recyclable, or compostable packaging. | 1 Support EPR policy and projects. | 1 Set up discount or reward schemes for reuse and recycling. |
| 2 Follow local or international design-for-recycling guidelines for packaging design. | 2 Actively engage with supply chain to convey the recyclability requirements. | 2 Test deposit and return schemes with retailer involvement to incentivise packaging collection. |
| 3 Use clear and harmonised labels to indicate recyclables. | | |
### Increase the use of recycled content

<table>

<td></td>
</tr>
</tbody>
</table>
### Key initial priorities for *policymakers*:

1. Cautiously evaluate the use of biodegradable and compostable plastics and develop guidance/criteria.

2. Develop harmonised labels for compostability to facilitate effective collection.

3. Assess China’s composting infrastructure and regional variability, and match these findings with existing compostability standards and certifications.

4. Enhance the collection system and composting infrastructure.

5. Provide guidance on when and where to use compostable packaging.

6. Work with composting facilities to ensure all composting materials put on the market are collected and composted.

### Key initial priorities for *businesses*:

1. Carefully assess the use of compostable packaging where relevant.

---

**TOWARDS A CIRCULAR ECONOMY FOR PLASTICS IN CHINA: OPPORTUNITIES AND RECOMMENDATIONS**
Establish a cross-value chain dialogue to achieve a common vision and targets.

To enable a shift in economic models requires the engagement of a diverse mix of private, public, and civil society organisations, including stakeholders from across the value chain.

It is important to start establishing strong partnerships and cooperation, working in an inclusive and collaborative process especially ensuring strong representation of the informal sectors, to harness expertise and break down traditionally siloed areas within and outside of government and industry, and facilitate the necessary policy coherence and alignment to catalyse concerted actions at all levels.
China can play an active and leading role in the development of an ambitious UN treaty on plastic pollution.

In March 2022, at the United Nations Environment Assembly, nearly 200 countries agreed to start negotiations on a legally binding agreement to take action on plastic pollution. This landmark decision to put in place a treaty that set rules for the production, use, and disposal of plastics globally will be looking at all major levers to tackle plastic pollution, including product design alongside recycling. Building a common vision and harmonised standards that strengthen coordination and a shared approach to address plastic pollution, the treaty is a key milestone towards a circular economy for plastics. As the biggest manufacturer, user, and exporter of plastics in the world, China can play a unique role in driving this agenda forward and raise global ambition.

In parallel, through bilateral and multilateral cooperation initiatives, such as the China-EU Memorandum of Understanding on Circular Economy Cooperation, the China-US Joint Declaration on Enhancing Climate Action in the 2020s, and the World Trade Organization (WTO) mechanism, China can help drive a global transition to a circular economy for plastics.

The current 14th Five Year Plan presents the foundations for a comprehensive transition to a circular economy for plastics that supports China’s carbon emission goals and broader environmental agenda. International cooperation efforts can support this ambition further and position China as a leading actor to deliver industry-scale change and end plastic pollution.

The time to act is now....
Acknowledgements
This work has been developed in collaboration with Tsinghua University, with a panel consisting of 20+ relevant experts, organisations, and members of the New Plastics Economy initiative (which includes many of the leading producers of packaged goods, and many of the largest retailers and packaging producers).
We are deeply grateful to all collaborators and contributors for the time and expertise they have dedicated to this project.
The recommendations presented in this work solely reflect the views of the project team. The team’s views have been formed on the basis of existing literature, expert interviews, workshops with the expert panel, and in-house analysis.

We are grateful for the support and guidance of our Advisory Panel members

About the Ellen MacArthur Foundation

The Ellen MacArthur Foundation is an international charity that develops and promotes the circular economy in order to tackle some of the biggest challenges of our time, such as climate change, biodiversity loss, waste, and pollution. We work with our network of private and public sector decision-makers, as well as academia, to build capacity, explore collaborative opportunities, and design and develop circular economy initiatives and solutions. Increasingly based on renewable energy, a circular economy is driven by design to eliminate waste, circulate products and materials, and regenerate nature, to create resilience and prosperity for business, the environment, and society.

About the Ellen MacArthur Foundation (UK) Beijing Representative Office

The Ellen MacArthur Foundation (UK) Beijing Representative Office has obtained official registration as an international NGO in China.

Since 2018, the Foundation has started working collaboratively with partners in China, recognising the rising momentum in the country towards transitioning to a circular economy, supported by policy and industry initiatives. With the guidance of the Ministry of Ecology and Environment of China, the Foundation obtained official registration in 2022, which enables the Foundation to scale up its operations, better collaborate with local stakeholders, and more effectively work towards our mission to accelerate the global transition to a circular economy and mobilise system solutions at scale.
